Surfacing:
- Flood coat of asphalt 60 lb (2.9 kg/m²)
- Gravel 400 lb (19.5 kg/m²)
- Slag 300 lb (14.6 kg/m²)

Aggregate density, size and coverage will determine actual weight.
Approximate installed weight: 452 - 658 lb (205 - 298.5 kg).

General
This specification is for use over any type of approved, lightweight, insulating concrete fill deck (without insulation) which can receive and adequately retain nails or other types of mechanical fasteners as may be recommended by the deck manufacturer. Examples of such decks are Zonolite, Celcore® and Elastizell. JM Ventsulation Felt is recommended over any wet fill deck and may be required as a condition of guarantee.

Design and installation of the deck and/or substrate must result in the roof draining freely and to outlets numerous enough and so located as to remove water promptly and completely. Areas where water ponds for more than 24 hours are unacceptable and are not eligible to receive a JM Peak Advantage Guarantee.

Note: All general instructions contained in the current JM Commercial/Industrial Roofing Systems Manual should be considered part of this specification.

Flashings
Flashings details can be found in Section 3 of the JM Commercial/Industrial Roofing Systems Manual.

Application
Note: On roof decks with slopes up to 1° per ft (83 mm/m), the roofing felts may be installed either perpendicular or parallel to the roof incline. On slopes over 1° per ft (83 mm/m), refer to Paragraph 11.0 of Section 3b for special requirements.

Using GlasBase Plus, PermaPly 28 or Ventsulation Felt, start with an 18” (457 mm) width sheet (the use of a specific base sheet may be a condition of guarantee). The following base sheet courses are to be applied full width, lapping the preceding felt 2” (51 mm) on the side laps and 4” (102 mm) on the end laps. Nail the side laps 9” (229 mm) o.c. Down the longitudinal center of each felt, place two rows of nails spaced approximately 11” (279 mm) apart, with the nails staggered on approximately 18” (457 mm) centers. Use nails or fasteners appropriate to the type of deck with 1” (25 mm) minimum diameter caps. Consult the current FM Approvals® RoofNav for the appropriate base sheet, fastener type and pattern.

Using GlasPly Premier or GlasPly IV, apply a piece 12” (305 mm) wide, then over that, one 24” (610 mm) wide, then over both, a full width piece. The following felts are to be applied full width, overlapping the preceding felts by 242/3” (627 mm) so that at least 3 plies of felt cover the base felt/substrate at all locations. Install each felt so that it is firmly and uniformly set, without voids, into the hot asphalt (within ±25°F [±14°C] of the EVT) applied just before the felt at a nominal rate of 23 lb/100 ft² (1.1 kg/m²) over the entire surface.

Surfacing
Flood the surface with the appropriate asphalt at an approximate rate of 60 lb/100 ft² (2.9 kg/m²). Into the hot asphalt, embed an acceptable gravel at a rate of 400 lb/100 ft² (19.5 kg/m²) or an acceptable slag at a rate of 300 lb/100 ft² (14.6 kg/m²). Aggregate must be installed so that there is complete coverage across the entire surface and at least 50 percent of the aggregate is solidly adhered in the hot asphalt. Aggregate should meet the requirements of ASTM D 1863.

Asphalt
Asphalt should meet the requirements of ASTM D 312. JM guarantees require the use of Trumbull** asphalt or another JM-approved asphalt.

Check with a JM Technical Services Specialist for special asphalt requirements in hot climates.
