Three-Ply (Two-Ply Asphalt, One-Ply Heat Welded) Modified Bitumen Mineral-Surfaced Roofing System. For use over Johns Manville (JM) insulation, approved decks or other approved insulations on inclines up to 3° per ft (250 mm/m).

**Materials per 100 ft² (9.29 m²) of roof area**

**Primer (if required):** JM Concrete Primer 1 gal (3.8 l)

**Intermediate Plies:**
- GlasPly Premier or GlasPly IV 2 layers

**Cap Sheet Options:**
- DynaWeld Cap FR or DynaClad* 1 layer

* DynaClad cannot be used for a membrane on any roof that will have significant foot traffic.

Approximate installed weight: 160 - 320 lb (72 - 145 kg).

**General**

This specification is for use over any type of approved structural deck which is not nailable and which provides a suitable surface to receive the roof. Poured and precast concrete decks require priming with JM Concrete Primer prior to application of the asphalt. This specification is not to be used over poured or precast gypsum decks, lightweight insulating concrete decks or fills without JM insulation.

This specification is also for use over JM roof insulations, or other approved roof insulations which are not nailable and which provide a suitable surface to receive the roof. Specific written approval is required for any roof insulation that is not supplied by JM. Insulation shall be installed in accordance with the appropriate JM insulation specification detailed in the JM Commercial/Industrial Roofing Systems Manual. This specification can also be used in certain re-roofing situations. Refer to the "Re-roofing" section of the JM Commercial/Industrial Roofing Systems Manual.

**Design and installation of the deck and/or roof substrate must result in the roof draining freely, to outlets numerous enough and so located as to remove water promptly and completely. Areas where water ponds for more than 24 hours are unacceptable and will not be eligible for a JM Peak Advantage Guarantee.**

**Flashings**

- Flashing details can be found in Section 3 of the JM Commercial/Industrial Roofing Systems Manual.

**Application**

- Roll an 18” (457 mm) wide piece of one of the intermediate plies listed into a full mopping of bitumen. Over that, apply a full width piece. The remaining plies are to be applied full width, overlapping the previous plies by 19” (483 mm), so that at least 2 plies cover the substrate at all locations.
- Apply all felts so that they are firmly and uniformly set, without voids, into the hot bitumen. Bitumen temperature should be the Equiviscous Temperature (EVT), ±25°F (±14°C), at the point of application. All felt edges shall be well sealed. The bitumen shall be applied just before the felt, at a nominal rate of 23 lb/100 ft² (1.1 kg/m²). When applying over insulations, more than 23 lb/100 ft² (1.1 kg/m²) of bitumen may be needed due to the absorbency of the insulation.
- Heat weld a full width piece of one of the cap sheets listed so that it is firmly and uniformly set. Subsequent sheets are to be applied in the same manner, with 4” (102 mm) side and 4” (102 mm) end laps over the preceding sheets.
- Apply all cap sheets so that they are firmly and uniformly set, without voids. Using a propane torch, apply the flame to the surface of the coiled portion of the roll. Torch across the full width of the roll and along the lap area. As the surface is heated, it will develop a sheen and the burnoff will disappear. The generation of smoke is an indication that the material is being overheated. Repeat the operation with subsequent rolls, maintaining proper side laps and end laps. A healthy compound flow will simplify seaming the laps. This is done by keeping the flame directed at the adhered ply and in front of the roll. At the end laps, soften the bitumen by heating the granule surface with the torch. When the granules start to sink into the bitumen, stop torching and with a hot trowel, embed the granules into the bitumen. All laps must be checked for good adhesion.
- Preparation of the 4” (102 mm) lap of DynaClad requires the removal of 4” (102 mm) of metal surfacing, creating the selvage edge. Next, apply heat to the lap that is being seamed, making sure there is a compound flow to adhere the two surfaces. All laps must be checked for good adhesion.
- For special precautions for heat weld applications, see Paragraph 31.0 of Section 3d of the JM Commercial/Industrial Roofing Systems Manual.

**Steep Slope Requirements**

Special procedures are required on incline over ½” per foot (41.6 mm/m). Refer to Paragraph 21.0 of Section 3d of the JM Commercial/Industrial Roofing Systems Manual.

**Surfacing**

- No additional surfacing is required.

Refer to the Material Safety Data Sheet and product label prior to using this product.
