Description
Moldable Glass Wool is a blanket made of glass fibers and highly specialized resin. This product is produced in an uncured state and is designed for use in applications that require excellent acoustical and thermal performance.

Applications
Moldable Glass Wool is specifically designed to be molded into hoodliners, dash insulators and other acoustical components.

Advantages
- Dimensional stability and strength
- Excellent acoustical control
- High thermal performance
- Heat resistance and low flammability
- Light weight and flexibility
- Resistance to automotive fluids
- Low moisture absorption
- Will not support microbial growth

Custom Fabrication
Fabricators specialize in secondary processing to supply custom parts to meet OEM-specific requirements. Die-cutting, laminating, special packaging and just-in-time delivery are just a few of the multiple capabilities our fabricators can provide.

Recommended Storage Conditions
Moldable Glass Wool should be stored at 40°F to 50°F (4°C to 10°C), with relative humidity between 30% and 90%, to retain molding characteristics. Depending on temperature and humidity conditions, the product will typically retain its molding characteristics for 14 to 21 days from the date of manufacture.

Product Molding Suggestions
Moldable Glass Wool uses a phenolic-based resin which cures when exposed to 325°F (163°C). Actual cure temperature and time will vary based on moisture content, density, desired finished thickness and finished part size. In all cases the product must be allowed to remove any moisture and reach 325°F (163°C) for a few seconds throughout the entire blanket. Please contact your JM Technical Representative for specific cure time and temperature for your application.

Available Forms
Moldable Glass Wool is available from Johns Manville as rolled blankets produced in weights of 38 grams to 72 grams per square foot and width combinations up to 120 inches. It is available in black or amber color options.
